

P200002234

**ABSTRACT**

Automatic coupling device for laminar bands for processes with continuous feeding, built up of two coil supports (1) and (2) above which a movable trolley (5) is incorporated in which some tiltable structures are situated foreseen of means for the automatic coupling of the bands proceeding from the coils (3) and (4) situated on the coil supports (1) and (2), having each tiltable structure an activating mechanism built up of two dissimilar cylinders opposed to one another which determine the operative positions of the mentioned structures.

**TITLE**

Automatic coupling device for laminar bands for processes with continuous feeding.
